This is a case report about imaging change of hyperglycemic nonketotic chorea. The author think rapid radiological resolution in the short intervals is useful to confirm the diagnosis of hyperglycemic nonketotic chorea without unnecessary investigations and treatments from the case. Actually, in previous published papers, the quick resolved CT or MRI lesions in basal ganglion have been reported, for example the paper from Guo Y, et al(Eur Neurol, 2014, 71(5-6):299-304). Additionally, there are several shortcomings about figures and references seen in the affiliated file.
