Reviewer’s report

Title: Clinical and Imaging Manifestations of Primary Cardiac Angiosarcoma

Version: 0 Date: 03 Jan 2019

Reviewer: Paweł Tyczyński

Reviewer's report:

Interesting report of nine cases of cardiac angiosarcoma. Taking into account the rarity of such disease, worth of considering publications.

My comments:

Introduction
Cardiac myosarcoma is very rare disease and truly stated by authors that mostly reported on a case-by case basis. However, the authors did not include in this manuscript. previous papers of case series or retrospective studies with relatively large number of patients. It would be worth to include such papers in introduction/discussion section.

Material and Methods

The authors state that "their disease histories ranged from two weeks to over 8 years". Do they mean angiosarcoma histories ? (8 years would be extremely long period for very low life expectancy in AS) Or do they mean for other comorbidities ? This is not clear at al.

Image analysis

Two radiologists, both with moe…- there is lack of their initials

Discussion

Although computed tomography is the standard cardiac tumors, however it would be worth to discuss the role of cardiac MRI in AS patients.

References

Style of references is quite careless and needs much improvements.

Figures

There is lack of any arrows indicating and explaining interesting features.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Unable to assess

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Yes

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.
