Reviewer’s report

Title: Bilateral Giant Retinal Tears in Osteogenesis Imperfecta

Version: 0 Date: 30 Oct 2017

Reviewer: Melissa Lees

Reviewer’s report:

This paper describes giant retinal tears in a rare form of autosomal recessive osteogenesis imperfecta, caused by mutations in the P3H1 gene, detailing the challenges of surgical repair in this group of conditions with scleral thinning.

The authors hypothesis a common pathway with other collagenopathies affecting the vitreous.

This is a rare case and therefore expands the phenotype and possible complications of P3H1 associated OI in the literature.

I would suggest that the gene LEPRE1 is referred to as a synonym of the gene P3H1, as the references largely allude to the former, and this may confuse the reader.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Yes

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Yes

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.
