Reviewer’s report

Title: Renal limited AL amyloidosis - a diagnostic and management dilemma

Version: 0 Date: 13 Jun 2018

Reviewer: Suchin Worawichawong

Reviewer's report:

The topic renal limited AL amyloidosis in MGUS patient is interesting, however there are some concerns should be addressed

1. What is the result of the immunofluorescent study of the first kidney biopsy, particularly light chain staining? and also the repeated one?

2. What is the result of Bone marrow biopsy when the repeated kidney biopsy was performed? The author mentioned negative result of bone marrow aspiration and biopsy before treated with chemotherapy.

3. Is there any study on electron microscopy?

4. The figures should have annotation to identify the pathologic findings. The figure legends of figure 4 and 6 do not correlate with the figures. All figures shown suggestive for deposition disease, but not convince for amyloidosis.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Yes

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Yes
Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.
