Reviewer’s report

Title:Hypopituitarism after subarachnoid haemorrhage (SAH), do we know enough? a systematic review

Version:1 Date:10 January 2014

Reviewer:ZULEYHA KARACA

Reviewer’s report:

The authors have systematically reviewed the literature regarding hypopituitarism after SAH. It has been written well in general. But I have some minor recommendations.

1. SAH is usually associated with single hormone deficiencies such as GH rather than multiple deficiencies. This should be clearly emphasized in the discussion and conclusion parts.
2. There are many spelling and linguistic errors. The manuscript needs to be checked for linguistic errors carefully.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.

Declaration of competing interests:
