Reviewer's report

Title: Insomnia as a covariate of community integration in persons with delayed recovery from mild traumatic brain injury

Version: 4 Date: 23 June 2015

Reviewer: Rongcai Jiang

Reviewer's report:

The manuscript is very interesting for the mTBI researchers since there are few reports related to the prognosis of the mTBI. This manuscript describe several outcome associated factors like insomnia, English level, Axis IV-TR malingering, time since injury and/or neck pain and marital status. Though the manuscript is titled by "Insomnia as a covariate of community integration in persons with delayed recovery from mild traumatic brain injury" and the role of insomnia is emphasized. However, I did not read any analysis why insomnia is the most important factors impact on the outcome of mTBI. one of the 4 hypothesis is "(3) insomnia would explain several post-concussive symptoms", however, I did not read the explanation.

Thus, the manuscript should be rewritten. The insomnia should be fully explained and described if the author persist to use this title.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: Yes, but I do not feel adequately qualified to assess the statistics.
