Title: Nitrous oxide induced subacute combined degeneration with longitudinally extensive myelopathy with inverted V-sign on spinal MRI: a case report and literature review

Version: 1 Date: 22 Aug 2017

Reviewer: Falk Mancke

Reviewer's report:

The authors have made some important revisions.

My main remaining point of criticism is that the authors should name what thorough neuropsychological examination they did, e.g., the CERAD test battery. And more importantly, they should add the results. This of even more relevance as this would add to the novelty of the case, which - at least in my view - is still very limited.

The authors should also check for typos, e.g. sometimes a word seems to be missing.
