Reviewer’s report

Title: Predictors of activity and participation across neurodegenerative conditions: a comparison of people with motor neurone disease, multiple sclerosis and Parkinson's disease.

Version: 0 Date: 03 Sep 2017

Reviewer: Won Seok Chang

Reviewer's report:

This study is a cross-sectional study of activity and participation in PD, MS, and MND patients. Studies have shown that the Ox-PAQ domain score for MND patients is inferior to that for other patients. In patients with chronic neurodegenerative disease, improvement in the quality of daily life and return to society is becoming an important goal of treatment. However, in the case of the diseases that was the subject of this study, the quality of life and activity were all different according to each stage of the disease. Therefore, the results of this study alone will not confirm that the quality of life or activity of MND patients is worse than other neurodegenerative diseases, and I think it would be reasonable to make a comparison of each disease after considering other factors such as stages and clinical conditions.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

No

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

No

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

No

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.

I am able to assess the statistics
