Reviewer's report

Title: Fertility desire and associated factors among people living with HIV attending Antiretroviral therapy clinic in Ethiopia, 2013

Version: 9 Date: 14 July 2014

Reviewer: Rhoda Wanyenze

Reviewer's report:

The authors have addressed most of the comments raised earlier, and the manuscript is much better. However, a number of issues are not fully addressed.

1. The language still requires major editing to ensure that the intended massages come across clearly. Some sections and sentences are also still too long and could be more concise while others are fragments (e.g. description of measures, last paragraph of page 6).

2. The discussion still requires significant adjustments: some sections of the discussion are largely a repeat of the quantitative results. The discussion of the qualitative component still presents a lot of results, some of these presented for the first time under the discussion section. The discussion should ideally be focusing on interpreting the findings and highlighting the policy/practice implications

Level of interest: An article of importance in its field

Quality of written English: Not suitable for publication unless extensively edited

Statistical review: No, the manuscript does not need to be seen by a statistician.
