Reviewer’s report

Title: Levels and determinants of continuum of care for maternal and newborn health in Cambodia—evidence from a population-based survey

Version: 5 Date: 16 January 2015

Reviewer: Sayeed Unisa

Reviewer’s report:

Paper is modified, and authors have strongly argued about the analyses carried out by them. They have discarded the suggestion of multinomial analysis. However, in my view, map is prepared using complete care as suggested by me and another reviewer.

I feel the analysis is not very insightful. Continuum of care is dependent on the quality of care, as well as obstetric problems, authors have entirely ignored this aspect. Many variables on obstetric problems and care are collected in the DHS survey. It is suggested that authors can make the index of quality of ANC when they want to run second analysis. Along with this they can see whether women had any problem during pregnancy. Similarly in the third analysis, quality of care as well as the delivery type (normal, forceps, cesarean) may be included.
