Reviewer's report

Title: Quality of Prenatal Care Questionnaire: psychometric testing in an Australia population

Version: 2 Date: 14 July 2015

Reviewer: Matthew Fuller-Tyszkiewicz

Reviewer's report:

The authors have addressed most of my concerns from the initial manuscript. However, I have two outstanding issues that I feel should be incorporated into the final manuscript.

Minor Essential Revisions
1. Include chi square and CFI (or TLI) as well.

2. Although in CFA the items will have zero loadings on the factors they do not load onto, it is still important for the reader to be able to see the factor loadings in order to ascertain the strength of correspondence between items and the underlying factors. Therefore, I would still like to see factor loadings included in Table 3. Item-total correlations do not separate true score and measurement variance, and are thus inaccurate representations of the item-factor relationship. The factor loadings in contrast, are unconfounded.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: Yes, and I have assessed the statistics in my report.
