Reviewer's report

Title: Clinicopathological study of centrally necrotizing carcinoma of the breast

Version: 4  Date: 26 November 2014

Reviewer: Julie Jorns

Reviewer's report:

Overall, this study presents a well-designed study with results that are clinically applicable. However, in general the results and discussion should be much more succinct. Additionally, the final manuscript should be reviewed by someone with English as a primary language because although the authors do a relatively good job with this there are still sentences that read strangely. For example, on page 10 "puncture" should probably be "needle" core biopsy (line 21) and sentences like "There were less radiographically reported." do not make sense. A couple of the figures also require revision for better presentation: 2b would be preferred as a digital whole mount image rather than a camera-taken picture of a slide and 4a has spots on the image.
