Reviewer's report

Title: Prolonged survival of a patient with metastatic leptomeningeal melanoma treated with BRAF inhibition-based therapy: a case report

Version: 2 Date: 10 February 2015

Reviewer: Christian Koelsche

Reviewer's report:

Kim et al. report the clinical history of a patient suffering from BRAF mutant melanoma, which spread multiple metastases involving the leptomeninges and the brain. The authors comprehensively described the response of all metastatic lesions against different therapeutic treatments. They observed a stable response of the leptomeningeal and parenchymal brain lesions to a combined targeted-therapy against BRAF. Finally, the authors critically discussed their observations.

It is a well written case report with clinical significance.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
