Reviewer's report

Title: Clinical Characteristics of Narrow-band Imaging of Oral Erythroplakia and Its Correlation with Pathology

Version: 2 Date: 2 February 2015

Reviewer: enver ozer

Reviewer's report:

I would like to congratulate the authors for their study which is the first to illustrate the correlation between the pathology and morphological pictures of NBI images in a large series of patients. Even though it is a subjective test, still contributing to the effectiveness of a non invasive test for this significant oral cavity problem is very important.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: Yes, but I do not feel adequately qualified to assess the statistics.
