Reviewer’s report:

It was a pleasure to read and review the article entitled "Assessment and model guided cancer screening promotion by village doctors in China: a randomized controlled trial"

This study is a quite well conducted study protocol looking at a quite important topic, especially in some resource-poor rural area. But I have a few minor concerns which can be found below.

1. The Background and first paragraph of discussion of the paper could be improved substantially by being written in a more simple and definitive manner.

2. The selection and randomization of the villages are clear. Eligibility criteria are clear. But as we all know that the majority of young man in the village nowadays are willing to go to the city to get more opportunity of have a good work, so I dont think the remained people of old age and lower level of education can represent the target population of the study.

3. The intervention is well described. But I am not sure is it possible for the farmers to go to the clinic every two weeks? And will them get enough information in CS counseling with only 10 minutes?

Level of interest: An article of limited interest

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
