Title: High PHLPP expression is associated with better prognosis in patients with resected lung adenocarcinoma

Version: 6 Date: 11 June 2015

Reviewer: Luka Brcic

Reviewer's report:

Dear Editor,

Dongqing Lv et al have done a good work with their manuscript "High PHLPP expression is associated with better prognosis in patients with resected lung adenocarcinoma", incorporating all our remarks, and responding adequately to them.

I have only one more addition for them to make, just to mention which TNM classification are they using (from which year, since tumors are in the period from 2008-2010).

English was also improved, but I would again suggest critical reading by English native speaker.

However, I would at this point recommend acceptance and publication.

Kind regards,

Luka Brcic

Level of interest: An article of importance in its field
