Reviewer's report

Title: Efficacy and safety of Vinflunine for advanced or metastatic urothelial carcinoma in routine practice based on the French multi-centre CURVE study

Version: 3 Date: 28 July 2015

Reviewer: Shilajit D. Kundu

Reviewer's report:

This article addresses an important topic in the treatment of metastatic urothelial carcinoma. They retrospectively review patients that received Vinflunine after chemotherapy for metastatic urothelial carcinoma.

While the idea is interesting, there is no comparison group in this cohort. This really makes the article difficult to assess. As the authors report in the figures, the outcomes of the patients depend highly on patient characteristics including performance status, volume of liver metastasis, etc. Often time, patients may survive longer periods of time on observation if they have good performance status.

I could not find any of the tables in the article as listed.

In order for this paper to be more relevant, there would need to be a more detailed report of prior therapies, failures, etc.

Grammar needs to be revised in some places.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: Yes, and I have assessed the statistics in my report.
