Reviewer’s report

Title: Multiple Intraneural Glomus Tumors In Different Digital Nerve Fascicles

Version: 0 Date: 21 Jun 2019

Reviewer: Anja Harder

Reviewer’s report:

This is a very interesting and well written case report of a rare manifestation of a glomus tumor. The data are well documented. I have some remarks for minor revision concerning a more precise description of the tumor itself:

1. Are there signs of malignancy in histology (atypical features, mitoses (count), pleomorphism)?
2. Can a glomangioma and a glomangiomyoma be ruled out? Are there oncocytic features?
3. Is a family history ruled out?

It would be really great if you could provide an analysis of a MIR143-NOTCH gene fusion, but if this is too complicated, than please provide better histological photographs including neurofilament stain. I would recommend to skip the synaptophysin staining (I think is just very weak) and better show a second HE stain of the tumor cell arrangement as well as a neurofilament stain to demonstrate nerve attachment.

I have no major concerns.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Unable to assess

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Yes
Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.
