Reviewer's report

Title: Rapidly evolving conjunctivitis due to Pasteurella multocida, occurring after direct inoculation with animal droplets in an immunocompromised host.

Version: 2 Date: 1 December 2014

Reviewer: Melike Balikoglu-Yilmaz

Reviewer's report:

I believe that this case report could make a contribution to medical knowledge and has educational value. It is also unexpected/unusual presentation of conjunctivitis in an immunocompromised patient. But it requires minor essential revisions.

This case report contains few weaknesses:

1. Applied treatment should be mentioned in abstract section.
2. The section related with microbiological assessment should be controlled by specialist.
3. Systemic antibiotherapy including amoxicillin 2g tid and amoxicillin/clavulanate 2g tid intravenously should be given information about transfer to the eyes. Why this treatment was preferred?
4. Figure captions should be written with more care.
5. Figure 1A is blurred. It should be reduced to include only eyes.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
