Reviewer’s report

Title: Disappearance of soft drusen and subsequent development of choroidal neovascularization following macular hole surgery: a case report

Version: 3  Date: 11 March 2015

Reviewer: Fang Chen

Reviewer’s report:

The authors report an interesting case whose soft drusen disappeared and CNV developed subsequently after macular hole surgery. It is a well-written report. However, the authors should explain to readers whether they touch and damage the macular hole base with some surgical instruments such flute needle, retinal brush, etc. As we know, CNV occurrence is tightly associated with the break of Bruch’s membrane. Therefore, touching macular hole base may be very important to the development of CNV.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
