Reviewer’s report

**Title:** Systemic adalimumab induces peripheral corneal infiltrates

**Version:** 3  
**Date:** 9 March 2015

**Reviewer:** Ali Djalilian

**Reviewer’s report:**

This is interesting case report. It seems reasonable to attribute the peripheral corneal infiltrates to the adalimumab therapy. The following information if available would strengthen the report:

- how long had the pt been treated with adalimumab before developing this reaction
- if the pt was contact lens wearer, what type (soft or hard, daily or extended) and for how long.
- had the pt undergone any specific genetic testing as part of their crohn’s disease
- did the pt have any history of meibmian gland disease (styes, marginal keratitism, etc) in the past?

**Level of interest:** An article whose findings are important to those with closely related research interests

**Quality of written English:** Needs some language corrections before being published

**Statistical review:** No, the manuscript does not need to be seen by a statistician.
