Reviewer’s report

Title: Spontaneous hyphaema secondary to bleeding from an iris microhaemangioma in a patient with a supratherapeutic International Normalised Ratio: case report

Version: 3 Date: 2 March 2015

Reviewer: Masood Naseripour

Reviewer’s report:

This is a well written article, however, the article has some flaws:
1) Probably the most important flaw of this article is that there is no fluorescein angiography to support the definite diagnosis iris hemangioma.
2) In addition to argon laser photocoagulation, topical and systemic steroid can be used to induce the tumor regression or hasten its spontaneous shrinkage.
3) Some interpretations regarding the mechanisms of bleeding in this case are personal opinions and they are not evidence-based.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
