Title: Two or more dexamethasone intravitreal implants in treatment-naive patients with macular edema due to retinal vein occlusion: subgroup analysis of a retrospective chart review study

Version: 1 Date: 12 March 2015

Reviewer: Emre Güler

Reviewer's report:

Comments to the author
I have some minor comments.

Methods
1 What was the diagnosis of macular edema based on? Clinical examination or OCT or FFA?
2 What was the brand name of the OCT? Was it a spectral domain one? If the OCTs were different due to the multicenter design of the study, this should be discussed, in particular the interchangeability for the devices.
3 The method for IOP measurement?
4 Did you analyze whether the distribution of values are normal or not? If so, which normality test was used?

Results
1. The first paragraph, the ranges should better be added for the mean baseline central macular thickness.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
