Reviewer’s report

Title: Transient traumatic isolated neurogenic ptosis after a mild head trauma: a case report and literature review

Version: 3 Date: 26 September 2015

Reviewer: Yonca Arat

Reviewer’s report:

Major compulsory revisions:
The authors built the whole article on the fact that the isolated neurogenic ptosis happened secondary to occipital trauma without any periorbital injury. But apparently there is a fracture at the roof of the orbit on the same side. Since the history of the injury is largely unknown and there is an orbital fracture, authors cannot claim that the ptosis happened without periocular injury. Although this was noted in the previous review and also partly mentioned in the second reviewer’s comments this was not addressed by the authors.

Upgaze and downgaze photos were not included as well.

Level of interest: An article of limited interest

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
