Reviewer's report

Title: Neovascular Glaucoma: A Retrospective Review From a Tertiary Center in China

Version: 2 Date: 7 July 2015

Reviewer: Luca M Rossetti

Reviewer's report:

- Major Compulsory Revisions

- The prevalence of NVG was 5.8%, consistent with the one reported for Asian population and this despite the fact that it’s coming from a tertiary practice. This point deserves discussion.

- Treatment modalities depended on different variables other than clinical conditions (e.g. reimbursement, copayment, etc.); this may lead to a biased estimate of success rates of the procedures. Needs discussion

- How many patients received an anti-VEGF injection?

- About 40% of NVG cases were lost to f-up. Did they differ accordingly to main prognostic factors from cases followed at the Center?

- The primary cause for NVG could not be determined in about 20% of cases. Please explain why (i.e. data not available?)

- Estimates of success rates of the different procedures and complications rates as well need to be compared with other studies on Asian population. Please put in the discussion.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
