Reviewer’s report

Title: Extensive bilateral corneal edema 6 weeks after cataract surgery: Keratopathy due to Asclepias physocarpa: a case report

Version: 0 Date: 14 Oct 2016

Reviewer: Christopher Ta

Reviewer's report:

This is a very interesting case report of a patient who developed bilateral cornea edema following presumed exposure to toxin associated with the plant Asclepias physocarpa. There is no direct evidence that the cause of the cornea edema is secondary to plant toxin, but the history and exam are consistent with the diagnosis.

The manuscript requires extensive English language editorial revision to meet the standard of a journal article. On page 6, it was confusing to read the transition from line 117 to 119, where the description was tapering of oral steroid by day 5 on line 117, and line 119 referred to day 2.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Unable to assess

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Yes

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.
