Reviewer’s report

Title: Case report: Acute angle closure attack after an intravitreal bevacizumab injection for branch retinal vein occlusion

Version: 0 Date: 29 Apr 2016

Reviewer: Argyrios Tzamalis

Reviewer's report:

All in all, this case report is a fair attempt to describe a prominent and persistent IOP spike after intravitreal injection. Although the manuscript is well written and comprehensive it is not unique in the literature and does not add much to our knowledge. Furthermore, I am not sure if the IOP increase could be attributed to an acute angle closure since the anterior chamber in the figures provided does not seem to be that shallow, especially in the centre. An anterior chamber OCT would be useful in that case. Moreover, the authors mention that the patient had a persistent ocular pain immediately following the intravitreal injection. In that case, the patient should be checked in the slit lamp without delay in order to avoid complications such as central retinal artery occlusion. If the authors did not do that, it could be considered as a medical pitfall. Finally, the authors should explain their choice to perform laser peripheral iridotomy in both eyes and clarify if they believe this has been helpful.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Unable to assess

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Unable to assess

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.
