Reviewer’s report

Title: Partially absorbed cataractous lens in the anterior chamber revealing neglected severe ocular contusion: a case report

Version: 0 Date: 06 Mar 2017

Reviewer: Douglas C. Witherspoon

Reviewer’s report:

This manuscript describes a case report of a 27 year old female who complained of pain and intermittent injection of the left eye for the past year. Vision was "no light perception" in the left eye and the patient related poor vision in the left eye since late childhood according to the patient's recollection. The clinical examination of the left eye revealed a small amount of "partially absorbed lens material" in the anterior chamber, mild anterior chamber reaction and a total, retinal detachment. The appearance of the retinal detachment by ultrasound was chronic with a tightly closed posterior funnel.

Previous trauma was proposed to be the underlying etiology for the abnormalities in the left eye, although the patient denied a history of trauma.

While this is an interesting case, this case report does not add to the existing world's literature regarding ocular trauma. The findings are well know potential complications of closed globe injuries.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Unable to assess

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Unable to assess

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.
