Reviewer's report

Title: Acute clouding of trifocal lens during implantation: a case report

Version: 2 Date: 08 Nov 2017

Reviewer: Passara Jongkhajornpong

Reviewer's report:

The revision was clear in all details.

However, in the conclusion, the author mentioned that "Therefore, we suggest that the IOL's temperature should be kept in normal range as manufacture's guideline requested before implantation. This may avoid IOL acute clouding resulting from lower temperature during implantation."

My understanding is that the temperature gradient from very low temperature outside (-3 C) to normal higher room temperature (20 C) and to higher human anterior chamber temperature, which is approximately about 25 C, results in the lens opacity. Therefore, the conclusion should be "IOL clouding resulting from higher temperature during implantation especially during winter season in the countries in temperate or polar zone".

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Unable to assess

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Unable to assess

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Unable to assess

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.
