Reviewer's report

Title: Dexamethasone implants in paediatric patients with noninfectious intermediate or posterior uveitis: First prospective exploratory case series

Version: 0 Date: 19 Aug 2017

Reviewer: Alejandro Fonollosa Calduch

Reviewer's report:

This an interesting and very well designed prospective study that tries to assess the safety and efficacy of dexamethasone intravitreal implants in children with non infectious uveitis. I see three major limitations in this work; two of them have been outlined by the authors: the small sample size and the short follow-up. From my point of view another limitation in order to achieve proper conclusions is that the authors have included two 17 years old patients. Although "legally" 17 years old is a non-adult age, in terms of eye physiology 17 years old eyes may be considered adults, at least "young" adults. At this moment, no definitive conclusions can be extracted from this work due to these 3 major limitations. I think the authors should carry on with this study, include more and younger children and present their results in a future work.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Yes

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

No

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.
