The manuscript „Case of Suprachoroidal Hemorrhage followed by Swept-Source Optical Coherence Tomography” by Uramoto et al” is an interesting case presentation, describing the resolution of a suprachoroidal hemorrhage by swept source OCT. The manuscript is well written and the authors are describing for the first time the resolution of the suprachoroidal blood by OCT.

The topic is interesting, but the authors should include more patients so that conclusions according to the morphology can be drawn. With an inclusion of one patient and presentation as a case report, the manuscript is only of modest interest. The manuscript is publishable, but I encourage the authors to include more patients with a suprachoroidal hemorrhage in a future study and compare the morphological OCT changes with the disease progression.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Yes

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Yes

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.

I am able to assess the statistics

Quality of written English
Please indicate the quality of language in the manuscript:
