Reviewer’s report

Title: Acute Emotional Stress as a Trigger for Intraocular Pressure Elevation in Glaucoma

Version: 0 Date: 13 Oct 2018

Reviewer: Xiangmei Kong

Reviewer’s report:

Glaucoma is a kind of typical psychosomatic disease. It is known that anxiety and depression are both related with glaucoma. Emotion stress is an important factor which could trigger acute attack of primary angle closure glaucoma. This paper described a case with pseudo-exfoliative glaucoma after filtration surgery suffered sudden IOP rise immediately following a family breakdown. This could remind us to pay more attention to glaucomatous patients' psychological status other than only focus on the eye itself.

As a case report, the materials of the patient should be provided more completely, such as the photos of anterior segment with filtration blebs and funds with optic nerve head. The difference of the severity between both eyes might play a role in the IOP acute rise.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Unable to assess

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Yes

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.
