Reviewer’s report

Title: Epidemiology and Clinical Features of Viral Anterior Uveitis in Southern Taiwan—Diagnosis with Polymerase Chain Reaction

Version: 1 Date: 06 Mar 2019

Reviewer: David Diaz Valle

Reviewer's report:

This is a retrospective study conducted over a period of more than 10 years that includes a sample exceeding 100 eyes with HLA B27 (-) anterior uveitis (AU) presenting with ocular hypertension or corneal edema in which they performed PCR of aqueous humor to assess the percentage of cases associated with herpetic viral infection. In addition, the authors conclude that there are no clinical features that allow differentiate CMV-positive and herpesvirade-negative eyes.

The article is well-written and I think that is interesting for the readers, so I consider that it can be accepted for publication without corrections.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

No

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Yes

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.

Yes
Quality of written English
Please indicate the quality of language in the manuscript:
