Reviewer’s report

Title: Morphological characteristics of ocular toxoplasmosis and its regression pattern on swept-source optical coherence tomography angiography: a case report

Version: 0 Date: 04 May 2019

Reviewer: Eduardo Amorim Novais

Reviewer's report:

This a case report of a patient with toxoplasmosis evaluated with multimodal imaging.

Few points should be addressed:

1) Background: 2nd paragraph: References needed

2) Page 5, first paragraph: the Hyporeflective nomenclature for OCTA images are incorrect. This nomenclature is used for structural OCT

3) It is odd to have active toxoplasmosis without vitreous cels on OCT B-scans.

4) Figure 2: It seems that the B, E and H images are structural En face oct and not en face oct angiography images.

5) Still on figure 2, the perilesion changes on the en face images appears to me to be secondary to signal attenuation and not due to vascular remodelling.

6) To evaluate changes on OCTa images, both structural and angiography en face images must be shown side by side.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Yes
Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.
Yes

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.
Not relevant to this manuscript
