Reviewer’s report

Title: Morphological characteristics of ocular toxoplasmosis and its regression pattern on swept-source optical coherence tomography angiography: a case report

Version: 0 Date: 26 Jun 2019

Reviewer: Won Lee

Reviewers report:

I agree that this may be the first report on the morphological changes in the choroidal vasculature surrounding ocular toxoplasmic lesions.

They described "the congested and dilated choroidal vessels" in the active phase. Also, they described that these changes may contribute to the thickening of choroidal layer.

However, dilatation of the Haller vessels on en face OCT is not evident in this case. Usually increased choroidal thickness is attributable to dilated Haller vessels. Could you provide other en face oct images?

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Unable to assess

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Yes

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.
