Reviewer’s report

Title: Improvements in visual acuity and macular morphology following cessation of anti-estrogen drugs in a patient with anti-estrogen maculopathy resembling macular telangiectasia type 2: a pathogenic hypothesis

Version: 2 Date: 10 Dec 2019

Reviewer: Leo Am Kim

Reviewer's report:

The authors have addressed my concerns and have added thoughtful discussion regarding the potential involvement of the photoreceptors, RPE and muller's cell in the development of anti-estrogen retinopathy. As mentioned before this is an interesting case and shows some reversibility of low dose tamoxifen, which has some value as it defies current understanding that tamoxifen toxicity is irreversible.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Unable to assess

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Yes

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.

Not relevant to this manuscript
