Reviewer’s report

Title: Effect of internal limiting membrane peeling on normal retinal function evaluated by microperimetry-3

Version: 0 Date: 29 Oct 2019

Reviewer: Eduardo Amorim Novais

Reviewer's report:

This is an interesting work that evaluates MP changes after ILM peeling for macular hole. Although this study was well conducted, few points should be addressed: 1) We often see retinal cysts surrounding the MH region. Those cysts could decrease retinal sensitivity (see pubmed published data). The resolution of those perifoveal cysts could also be the cause of increased sensitivity. Thus, I believe that multimodal imaging using OCT to exclude possible perifoveal cysts would be important. 2) Page 4, Line 28 - Vitreous "cavity" instead of just "vitreous"

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Unable to assess

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Yes

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.

I am able to assess the statistics

Quality of written English
Please indicate the quality of language in the manuscript:
