Reviewer’s report

**Title:** Presence of anti-Toxocara canis antibodies and risk factors in children in a semirural population of Mexico.

**Version:** 2  **Date:** 2 December 2014

**Reviewer:** Malgorzata Paul

**Reviewer’s report:**

A valuable epidemiological study on seroprevalence and risk factors of Toxocara spp. infection in children and adolescents. The study describes a very important and usually underestimated health problem of a global significance, especially in developing countries.

The Authors are asked to describe levels of Toxocara seropositivity more precisely in different groups of age to show a potential tendency to increase/decline within age; an appropriate figure/graph with a seropositivity distribution is welcome.

There is a suggestion of including a geographical map of various regions/towns where Toxocara seroprevalence has been studied.

**Level of interest:** An article of importance in its field

**Quality of written English:** Needs some language corrections before being published

**Statistical review:** No, the manuscript does not need to be seen by a statistician.
