Title: Characteristics of positive-interaction parenting style among primiparous teenage, optimal age, and advanced age mothers in Canada

Version: 0 Date: 15 Oct 2016

Reviewer: Rong Liu

Reviewer's report:

The objective of this analysis is to exam whether the positive-interaction parenting style differs among mother-groups with teen age, optimal or advanced age, and to identify characteristics relative to positive-interaction parenting style, respectively for each age group. The researchers used data from Canadian National Longitudinal Children and Youth (year 2000-2008) and appropriate statistics methods were applied. Although the findings from this analysis could not support any causality from mother's characteristics to positive-interaction parenting style, they still have strong public health implication through information decimations to first-time mothers, clinicians, researcher and public health facilities.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Yes

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Yes

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.

I am able to assess the statistics
Quality of written English
