Title: Case report: low-titre anti-Yo reactivity in a female patient with psychotic syndrome and frontoparieto-cerebellar atrophy

Version: 2 Date: 19 February 2015

Reviewer: Pedro Shiozawa

Reviewer’s report:

MINOR ESSENTIAL REVISIONS

1) the authors describe that psychotic symptoms persisted despite drug abstinence. A more detailed time set should be provided as to highlight the issue of drug induced psychosis.

The authors should discuss briefly the finding of a small arachnoidal cyst in the left temporopolar region and whether it should be related to psychosis presentation or not.

3) Regarding treatment, the use of a combined pharmacological approach with risperidone (4 mg/day) and quetiapine (300 mg/day) was based entirely on clinical basis? Was it due to a specific treatment protocol?

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
