Major Compulsory Revisions

1. Whether the data collected for an end-of-project evaluation or not fails to address the main issue concerning the sampling scheme used; that is to which population the results can be generalized. Because convenience sampling was used, generalizing the findings beyond the sample of MSM actually interviewed for the study has no formal scientific basis. The authors might argue that the sample is "judgmentally representative," but they need to make a case for this. They need to compare the characteristics of the sample of MSM with other data or studies. They also need to address the issue of why they think that collecting data only form MSM found at hot spots and not from "hidden" MSM will not affect the results. The manuscript may be publishable if the authors address this issue more seriously.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: Yes, and I have assessed the statistics in my report.
