Reviewer's report

Title: Using Prediction Markets of Market Scoring Rule to Forecast Infectious Diseases: A Case Study in Taiwan

Version: 2 Date: 4 April 2015

Reviewer: Alessio Signorini

Reviewer's report:

Major
The paper fails to convince me that something like 67% of wins for EPM on a particular week is a reliable/stable number as oppose as a temporary fluke. How close did the prediction get? What are the confidence intervals?

You often mention the amount of H$ traded but it is not clear how this impact anything in the paper. Can you be more specific?

Minor
English mistake on like 96.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: Yes, but I do not feel adequately qualified to assess the statistics.
