Reviewer's report

Title: Association of physical activity with blood pressure and blood glucose among Malaysian adults: a population-based study

Version: 5  Date: 6 October 2015

Reviewer: Anthony Laverty

Reviewer's report:

This manuscript is much improved, I have a few minor points:

The abstract would be more informative with actual values in results
I am not clear what a “gazetted area” means so this could be clarified
The results section is still quite short, and for example does not discuss the blood glucose results
The claim that there may be a positive relationship between PA and SBP because men do more PA is rather unconvincing – especially as you have controlled for sex in the analyses

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.

Declaration of competing interests:
