Reviewer's report

Title: Wrist flexion and extension torques measured by highly sensitive dynamometer in healthy subjects from 5 to 80 years

Version: 2 Date: 25 November 2014

Reviewer: Peter Hamer

Reviewer's report:

The authors have responded positively to my previous reviewer's report and the report from the other reviewer. The authors responses have strengthened and extended the presentation and discussion of their results and explained how they have approached the review report. In this discussion they have emphasised how the readers should use the data presented and the predictive models. This explanation is commendable and hopefully guide the proper use of the data. I am supportive of the responses and the modifications and extensions within the manuscript.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: Yes, and I have assessed the statistics in my report.

Declaration of competing interests:

I declare that I have no competing interests.
