Reviewer's report

**Title:** Treatment of pelvic fractures through a less invasive ilioinguinal approach combined with a minimally invasive posterior approach

**Version:** 3  **Date:** 12 April 2015

**Reviewer:** Daniel Balbachevsky

**Reviewer's report:**

Minor Essential Revisions

line 57: stablise = stabilize

line 59: I'd suggest "internal fixation" instead of "open fixation"

line 68: stablise = stabilize

line 91: I believe the reduction was done in a closed manner. So I'd suggest to modify the term "open fixation"

line 138: "sterilising" seems inadequate for the patient

line 155: I'd suggest "possible infection" instead of "probable infection"

line 267-270: Acetabular both column fractures are not the aim of this approach! So I'd suggest to eliminate this part.

line 274: we = We

line 279: stablisation = stabilization

**Level of interest:** An article of importance in its field

**Quality of written English:** Needs some language corrections before being published

**Statistical review:** No, the manuscript does not need to be seen by a statistician.
