Reviewer's report

Title: Outcomes after Fixation for Undisplaced Femoral Neck Fracture Compared to Hemiarthroplasty for Displaced Femoral Neck Fracture among Elderly

Version: 4 Date: 15 January 2015

Reviewer: Ely Steinberg

Reviewer's report:

The authors analyzed outcomes of two cohort groups with hip fractures, undisplaced and displaced. Each group was treated differently, one by fixation and the other by hemiarthroplasty.

Methods:
- No fracture classification and no information about the implant types were presented.
- There was no information regarding time to surgery. Studies reported that surgery within 48 hours could affect survival rate.

Results:
- Figure 1a, death should be changed to mortality.

Generally speaking, although it is a big study group the study brings no novelty, the style of writing needs some polishing before this paper can be considered for publication.

Level of interest: An article of limited interest

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
