Reviewer's report

Title: A comparison of Bipolar hemiarthroplasty and total hip arthroplasty for displaced femoral neck fractures in the healthy elderly: A Meta analysis

Version: 4 Date: 18 July 2015

Reviewer: Yoram Weil

Reviewer's report:

Greatly improved and conclusions are better phrased. There are still some issues to be addressed. The authors failed to stratify or differentiate between the more young and active patient group (healthy < 75, active etc'). This is of paramount importance since this is the group of patients were long-term results are important. Also, a note regarding the limitation of the use of the HHS. Otherwise if these cirteria are met the manuscript is worthy of publications

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: Yes, and I have assessed the statistics in my report.
