Reviewer’s report

Title: Open subpectoral biceps tenodesis in patients over 65 does not result in an increased rate of complications

Version: 0 Date: 26 Jun 2017

Reviewer: Davide Susta

Reviewer’s report:

1. It would be useful to add to the 'Introduction' more information about the reasons for a patient to select tenodesis instead of tenotomy (is there any advantage in relation to movement control? any improvement in strength? any functional, objectively measurable outcome favouring tenodesis?)

2. The number of participants was 380 at recruitment, but in the result section the number of patients is 337, what were the exclusion criteria to justify including only 337 (314 vs 22) out of 380? Please explain in text.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Yes

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Yes

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.

I am able to assess the statistics
