Reviewer’s report

Title: The Correlation between 2D Femoral Notch Parameters and 3D Notch Volume: a Retrospective MRI Study

Version: 1 Date: 11 Mar 2019

Reviewer: Asbjørn Årøen

Reviewer's report:

Have read the revised version and find that the authors have responded adequate to all the points put forward in the review. However I do wonder about a detail in line 156 in which it is stated that contact injuries are excluded because they might not be related to internal risk factors. This make me worry that almost all soccer and handball injuries are not included. In respect to an ultimate goal of prevention of these knee injuries, this might be misinterpretation would like the authors to report either in a table or a diagram the causes of these injuries to make it comparable with other manuscript in the field. Alternatively they might add a reference on the same topic in which the same approach is used.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Yes

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Yes

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.

I am able to assess the statistics
