Reviewer’s report

Title: A case of a perforated obturator hernia with a femoral abscess repaired using the pectineus muscle

Version: 5 Date: 8 July 2015

Reviewer: Takahiro Karasaki

Reviewer’s report:

Minor Essential Revisions

(1) To be exact, the repair method of obturator hernia was primary closure, and the pectineus muscle was used to fill the dead space. If they can, the authors should consider revising the journal title from this context. (e.g.) A case of a perforated obturator hernia with a femoral abscess treated with a pectineus muscle flap.

(2) The quality of the hand-written figures are still inadequate for the journal with impact factor >1. The drawings should be painted with painting tools.

Level of interest: An article of limited interest

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
